

chatmarket. *App & site flow*, end to end.

Buyer, seller, and moderation journeys with low-fidelity wireframes for every key screen across mobile, tablet, and desktop — built to match the chatmarket brand system so it can be handed straight to Claude for implementation.

Prepared for chatmarket · v1.0 · August 2026
Covers: Buyer flow · Seller flow · Admin/moderation flow · Responsive design system

What's in this document

Read it top to bottom, or jump to the section you need when briefing Claude on a specific part of the build.

Section	Covers
1. Design system reference	Colors, type, breakpoints, and navigation patterns pulled from the existing landing page
2. Information architecture	Full sitemap across buyer, seller, and admin surfaces
3. Buyer flow	Journey diagram + 6 key screens (mobile / tablet / desktop)
4. Seller flow	Journey diagram + 7 key screens (mobile / tablet / desktop)
5. Admin / moderation flow	Journey diagram + 4 key screens (mobile / tablet / desktop)
6. Responsive behavior notes	How navigation, grids, and components adapt per breakpoint
7. Component reference	Reusable components to build once and share across screens

Carried over from the landing page

Every wireframe in this document reuses these tokens so the app feels continuous with chatmarket-landing-final.html.

Ink
#14213D

Paper
#EDEEEA

Paper card
#F7F7F4

Amber
#E2A83E

Amber deep
#C68F2A

Teal
#2F6F62

Rule
#D8D5C9

Token	Use
Fraunces (serif, italic accents)	Headlines, prices, brand wordmark, section titles
IBM Plex Sans	Body copy, labels, buttons, nav
IBM Plex Mono	Metadata: message counts, % complete, timestamps, order refs
Amber fill / dashed rule + lock badge	The "locked thread" motif — reused everywhere a thread is preview-only

BREAKPOINTS

Breakpoint	Range	Layout behavior
Mobile	< 600px (Android / iOS / Pixel)	Single column, bottom tab bar, sticky compact top bar with back arrow
Tablet	600-1024px (iPad / Android tablet)	2-3 column grids, top bar with full nav, sidebar appears on dashboard screens
Desktop / Laptop	> 1024px	3-4 column grids, persistent sidebar on dashboards, hover states on cards

Sitemap

Three role-based surfaces sharing one component library and one auth/account layer.

Surface	Top-level routes
Public / Buyer	Home · Category browse · Search results · Thread detail (locked) · Checkout · Order confirmation · Order history · Account settings
Seller	Seller onboarding · Create listing (3-step) · Listing status · Seller dashboard · Listings · Orders · Payouts · Settings
Admin	Moderation queue · Thread review detail · Flagged / reported threads · Payout approvals · Users · Settings

SHARED LAYER

- Single sign-on: the same account can browse, sell, and (if staff) moderate — role switch happens via the account menu, not a separate login.
- One thread data model powers three renderings: locked card (buyer browse), listing row (seller dashboard), review card (admin queue).
- Payments, screening, and payout status are all attached to the thread object, not siloed per surface.

Buyer

Journey: browse → unlock → continue

The core loop the whole product is built around: someone else's stalled thread becomes your head start.

- Buyer lands on Home, either from search/ads or a direct link to a category.
- Locked preview shows just enough (first few messages, message count, % complete) to justify the price — never the full solution.
- Checkout is a single screen: order summary, Razorpay methods, and a visible 48-hour hold notice before purchase.
- On payment success the thread unlocks instantly; buyer can jump straight into Claude/ChatGPT/Gemini with the full transcript.
- Rating is requested after the 48-hour window closes, once payout to the seller has also been confirmed.

Seller

Journey: list → screen → get paid

Selling a stalled thread should take under five minutes — the 3-step listing wizard is designed around that constraint.

- Onboarding collects payout details once, up front, so first-time sellers aren't blocked mid-listing later.
- Step 1 (upload) auto-detects source model and message count from the export file — seller doesn't retype metadata.
- Step 3 shows the commission split transparently before submit, not as a surprise on the payout screen.
- Screening runs automated PII/credential scanning on every listing, plus a human check for a seller's earliest listings.
- Payout is held 48 hours after buyer unlock so a buyer can flag a broken/misrepresented thread before funds release.

Admin

Journey: screen → publish → handle reports

Trust is the entire value proposition — this flow is what keeps a locked preview from becoming a support nightmare.

- Automated scan runs first and catches obvious PII/credential leaks before a human ever sees the thread.
- Human review is scoped to early-stage sellers (e.g. first 3 listings) rather than every submission, to keep queue times low.
- Rejections always include a reason so the seller can fix and resubmit without opening a support ticket.
- Post-publish reports route to the same reviewer view as pre-publish screening — one component, two entry points.
- A valid report triggers refund + delist; an invalid one is dismissed and the thread stays live.

How each pattern adapts

These rules apply across every screen in this document — implement them once at the layout level, not per-screen.

Pattern	Mobile	Tablet	Desktop / Laptop
Primary navigation	Bottom tab bar (Home, Browse, Sell, Orders, You)	Top bar, full links visible	Top bar, full links + account menu
Dashboard navigation (seller/admin)	Horizontal scrollable tab row under the top bar	Persistent left sidebar, icon + label	Persistent left sidebar, wider, with section grouping
Thread/product grid	2 columns	3 columns	4 columns
Checkout	Single column, sticky "Pay" button at bottom	Single column, wider summary card	Two-column: summary left, payment right
Thread detail (locked preview)	Full-width card, buttons stack	Card capped at ~520px, buttons inline	Card + side rail for "similar threads"
Tables (dashboard, payouts, moderation)	Convert to stacked list rows (label: value)	Horizontal scroll within card	Full table, all columns visible
Forms (listing wizard, onboarding)	One field per row, full width	Two fields per row where related	Form + live preview side by side

PLATFORM-SPECIFIC NOTES

- **iOS:** respect safe-area insets for the bottom tab bar; use the native share sheet for "share this thread".
- **Android / Google Pixel:** support the system back gesture on all detail/checkout screens; material-style ripple on primary buttons is optional but should stay within the amber/ink palette.
- **Foldables / large tablets:** treat as desktop breakpoint once width exceeds ~840px rather than adding a fourth bespoke layout.
- **Laptop / desktop:** checkout and thread-detail screens gain a second column; nothing else in the buyer flow does — resist adding sidebars where mobile parity matters for conversion.

Build these once, reuse everywhere

Every wireframe in this document is composed from this set — implementing it as a shared library keeps buyer, seller, and admin surfaces visually consistent.

Component	Used in	Key states
Thread card	Home, category grid, search results	default · locked (amber accent) · unlocked
Locked preview card	Thread detail, listing status (seller), review detail (admin)	previewing · screening · unlocked
Category pill / tag selector	Home, search, listing wizard step 2	default · selected · scrollable overflow (mobile)
Status badge	Order history, seller dashboard, admin queue	pending · in screening · live · unlocked · flagged
Summary / total box	Checkout, payouts	default · held funds variant
Sidebar nav (dashboard)	Seller dashboard, admin	active item highlight; collapses to horizontal tabs on mobile
Table → stacked-list responsive pair	Payouts, moderation queue, order history	table (tablet/desktop) vs. list rows (mobile)
Flag list item	Admin review, reports	flagged · approved · rejected

HANDING THIS TO CLAUDE

- Reference this document alongside chatmarket-landing-final.html so component styling (colors, radii, type) stays consistent between the marketing site and the app.
- Build the component library first (section 7), then the three flows in order: buyer → seller → admin, since each reuses primitives from the one before it.
